■ LiMux – free software in Munich

**11.2007**

**LiMux**  
Die IT-Evolution

# Agenda

**Munich's IT world**

**The history of the LiMux project**

**The LiMux basic operating system**

**The infrastructure of a basic operating system**

**The business applications**

**The migration to OpenOffice**

**The LiMux project in the city council**

**The migration in the departments**

**Next steps and contact**

# The IT situation in Munich's administration

## Technical

- ~ 14,000 PCs, 16,000 users
- MS Windows NT 4 and Office 97/2000
- ~ 170 business applications (not including base applications)
- ~ 300 software products
- Different file services
- Centralized and distributed directory services
- Different products for system and config management and software distribution
- Different MS Office solutions for template and text module management
- Only e-mail and LDAP is one and the same

## Organizational

- 17 units running their own IT
- 850 IT staff members
- 120 project members
- Centralized steering for strategy and procurement
- Decentralized planning and operating
- Different operating and support concepts
- 12 departments with different infrastructure
- No common standardized procedures

# Why are we forced to migrate?

## Microsoft stopped support for NT4

- New software versions only for current operating systems
- New hardware is only supported by new operating systems (eg USB)

## ► Migration to

- Successor of NT4 or
- Different platform

# Main decisions 2003

**Free software (Open Source) for the operating system and office**

**New client/server applications will be developed or with web-based access**

## ► Thus

- More independence from software producers
- More equality of opportunities
- More competition in the software market
- Complete open source code (maintenance, security)
- Middle term monitoring of costs (reduction)
- Better protection from virus attacks

# To LiMux or not To LiMux ...? (The way of decisions)

## Preliminary study

- 2001: City council demands examination of alternatives to MS
- 2002: City council authorizes the IT administration to carry out a preliminary study
- 2002/2003: Preliminary study with the company Unilog

## Detailed conception

- 2003: City council authorizes the IT administration to initiate a detailed concept
- 2003/2004: Detailed concept developed with IBM and SuSE/Novell
- 2004: IT Administration gives the task to realize migration

## Migration

- 2005: Project preparation phase including first tenders
- 2006 – 2009: Conversion process to LiMux

# LiMux project tasks

## Organizational

- Implementation of service and support processes (ITIL) for the basic operating system
- Definition of a standardized basic operating system
- Internal and external communication
- Coordinate the office software migration
- Projekt coordination and monitoring
- One solution for one task
- Minimize redundancy of extra software
- More competition on the IT market

## Technical

- Development of a basic operating system
- Support of office migration
- Support of business application migration
- Standardized login service for a basic operating system
- Software distribution, system and config management for the basic operating system

# Estimated costs after detailed conception

# Selection of a suitable distribution

**...was not a selection of a existing distribution, but a search for a suitable solution with open source software for the complete IT, even business applications and the backend**

## We asked for

- A service provider for the customized configuration
- A support and maintenance provider

## The selection was

- Not a tender of a basic operating system
- Service provider should suggest a distribution
- ▶ **Tender for a concept, not a software product**

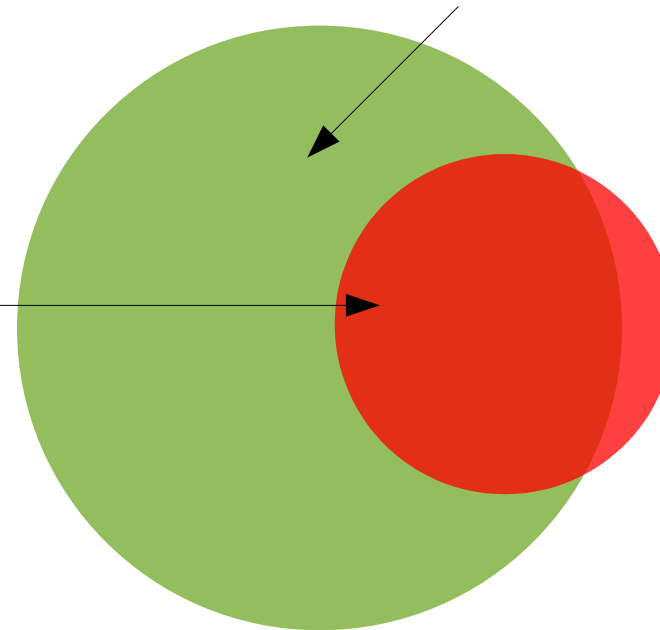

# Two main choices

Small and free base distribution

Requirements of Munich

Commercial distribution

# Main components of the basic operating system

## Distribution / base system

- Debian GNU/Linux sarge

## Graphical user interface

- K Desktop Environment (KDE 3.5)
- XOrg X-Server

## Office system

- OpenOffice 2.x

## Communication

- Thunderbird 1.5.x
- Firefox 1.5.x

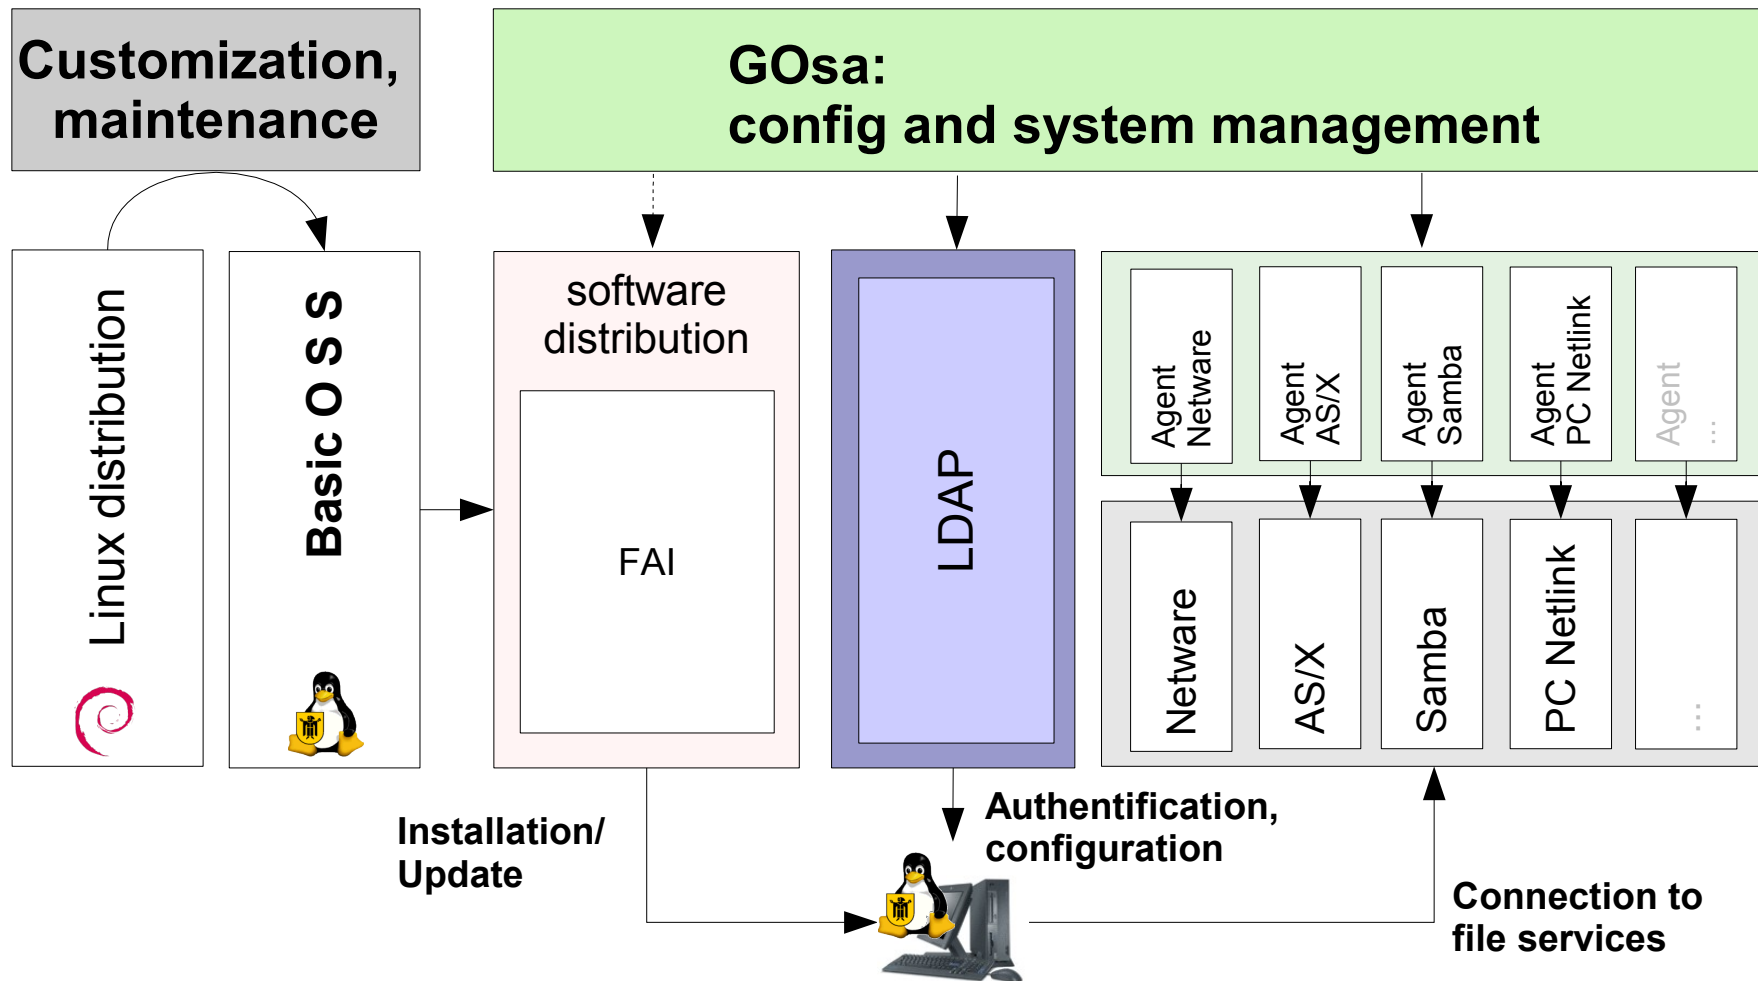

## Image editing

- GIMP 2.x

# Software distribution and system/config management

(<http://gosa.gonicus.de>)

# Infrastructure for the base client

# The migration szenarios for business applications

# Migration to Open Office - Problem of existing office templates

## Actual quantity taken during detailed conception (templates, macros, forms)

- Ca. 13,000 objects must be migrated
- Some software solution redundancies - different solutions for same problems
- Problems in file exchange expected

## ► Consolidation and coordination of the migration

- Development of a template and text module system „Wollmux“
- One solution for one problem, web based if possible
- Support of IT offices by an office support center
- Assistance / help for file exchange problems

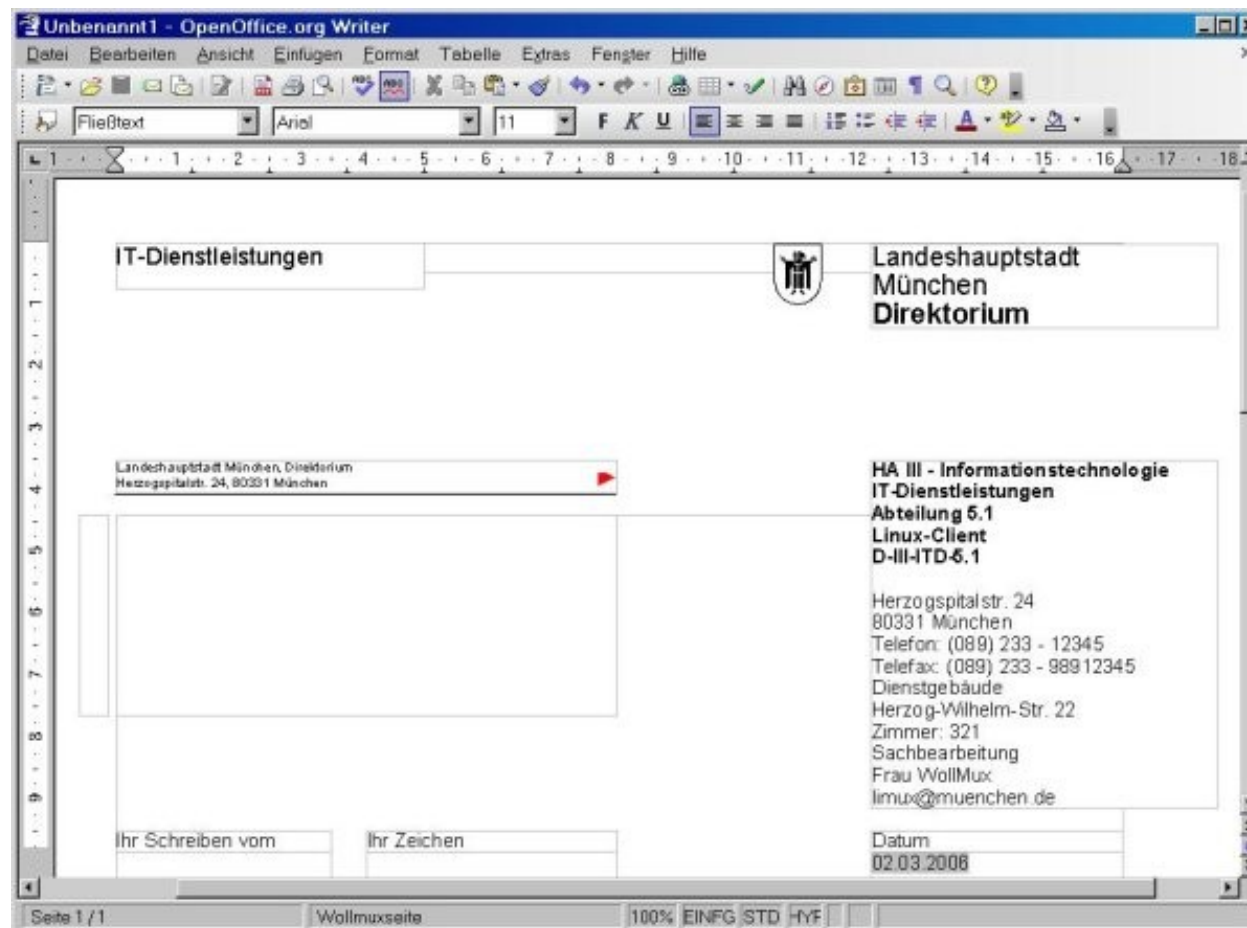

# Templates and text modules with Wollmux (1/2)

**"Eierlegender WollMux" is the title of a project to develop an office solution including the following components**

- Letter head system:  
Fill in user data automatically, writing as another person
- Form system:  
Assists the assembling documents based on templates, which require special input, template selection, automatic printing of different drafts or document versions, automatic calculation of values based on input and filling in the right spaces
- Text module system:  
Assistance the assembling documents with text modules
- Assistance for paper based workflows

# Screenshot Wollmux (2/2)

# Two worlds coexist: MS Office and

## Gradual migration to a basic operating system

- Migration to OpenOffice under MS Windows possible, not a must
- Parallel use of OpenOffice and MS Office

## File exchange necessary

- Internally
- Externally

### ▶ **Straight tips to file exchange**

# Straight tips to file exchange

## Inside and understanding

- Correct use of text processing software saves a lot adaption time
- Paragraph and format templates instead of direct formatting
- Paragraph and format templates instead of manual word-wraps
- Customized tab stops instead of blanks or more tabs

# LiMux project team

## Members

- Projekt headquarter (6 persons)
- Client Development and office migration (16 persons)
- Controlling and external assistance (8 persons)
- Subprojects and other roles in the project (ca. 100 persons additionally to normal work)

## Subprojects

- Linux client
- Pilot, coordinat and roll out
- Migrat business applications
- Education
- Infrastructure
- Usability
- Communication and PR

# Motivating the employees for the LiMux project

## Communication

- Communication team out of all departments for exchange of information and experiences
- Activities: performances, presentations, events and sampling demonstrations
- Mux to engage sympathy and identity
- E-mail, intranet, newsletter, forum, wiki
- Marketing: projectflyer, posters, give aways, lottery
- Face-to-face talks
- Invitation to improve the basic operating system

## Education

- Subproject education
- Individual migration training
- New software training
- E-learning platform

# The migration in the departments

## Organisation

- Voluntary pilots with Linux in 3 departments
- Time to iron out any teething problems
- Way of migration is individual
  - soft: Open office and Firefox and Thunderbird (Windows)
  - direct: Linux
- Uncritical users first
- The basic operating system „Basisclient 1.0“ is released since september 2006 and its usability is certificated
- E-learning platform is approved since december 2006 and awarded

## Up to date (November 2007)

- In 3 units (Dir, Kult and RevA) 660 workstation computer are converted to Linux
- 200 additional test workstations are installed and administrated
- 4700 employees trained in open source software
- 5000 workstations with open source software under Windows
- 80 administrators trained in LiMux

# Next steps

- Effective client rollout
- Gradual development of a basic operating system
- Incremental further development of WollMux
- More offices migrate to a basic operating system
- More offices use free software for Microsoft Windows (e.g. OpenOffice.org, Firefox, Thunderbird, Gimp)
